

CASEORA

AI-Powered Advocate Case Management System

Software Requirements Specification (SRS)

Tagline: One Case. One Timeline. Complete Control.

Simple-language version

This document explains what CASEORA should do, how its main features work, and what information it should store. It is written so that a developer, advocate, student, or reviewer can understand the idea quickly.

1. Project Overview

CASEORA is a digital case-management system made for advocates and their legal teams. It keeps case information, clients, court details, hearings, documents, tasks, orders, and case history in one organized place.

Instead of checking many files, notebooks, and reminders, the advocate can open one case and see its complete record and timeline.

CASEORA also includes AI features that turn complex case records and court orders into simpler summaries. AI is an assistant only; important facts, legal conclusions, and decisions must be checked against original court records and applicable law.

2. Advocate Profile

Each advocate has a profile containing the information needed to identify and contact them.

Information stored: advocate name, enrollment number, Bar Council details, mobile number, email, office address, specialization, and profile photo.

3. Case Registration

Every new case gets a CASEORA Case ID, for example CASE-2026-001. The system stores the official case information so the advocate can quickly understand where the case belongs and its current status.

Information stored: case number, case type, year, filing date, registration date, court, court number, judge, district, state, status, and priority.

Case status examples: Active, Pending, Disposed, or Transferred. Priority can be Low, Medium, High, or Critical.

4. Client & Opposite Party Details

CASEORA stores both sides of the case. This makes it easy to know who the advocate represents and who is on the opposite side.

Client details: name, contact details, address, and role such as Plaintiff, Defendant, Applicant, Respondent, Petitioner, Appellant, Accused, or Complainant.

Opposite side: opposite party name and details, plus the name and contact of the opposite advocate when available.

5. Court & Legal Details

Each case contains complete court information so the advocate can identify the exact court and legal matter.

Information stored: court name and address, court/bench number, judge or bench, case number, filing number, registration number, CNR number, FIR number where applicable, police station, sections/Acts, and related cases.

6. Hearing Calendar

CASEORA provides a calendar for all hearings. Each hearing can contain its date, court, purpose, previous proceedings, next action, next hearing date, and reminders.

Simple flow: Before the hearing → see what happened earlier and what must be prepared. After the hearing → record what happened and what must be done next.

7. Case Diary

After a hearing, the advocate can create a detailed diary entry. It records what happened during the hearing and what should happen next.

Diary information: what happened, what the court said, what the advocate submitted, whether the client and opposite party were present, whether exemption was required, court decision, next step, and next hearing date.

Important difference: Previous Proceedings gives a short historical context for the current hearing. Case Diary is the detailed record created for a particular hearing.

8. Exemption Management

If a client cannot attend a hearing, CASEORA can store the exemption-related information and documents.

Information stored: client, hearing date, reason for absence, exemption application, supporting document, submission date, court response, order, and next date.

9. Task Management

CASEORA helps the advocate and team remember work that must be completed.

Examples: Prepare Reply, File Exemption, Prepare Affidavit, Collect Documents, Submit Evidence, Prepare Arguments, Check Order, Contact Client, Prepare Bail Application, and Submit Compliance.

Each task has a due date, priority, status, and assigned person. Status can be Pending, In Progress, Completed, or Overdue.

10. Document Management

All case documents are organized inside the relevant case instead of being scattered across different locations.

Folders: Petition/Plaint, Written Statement, Replies, Applications, Exemption, Evidence, Affidavits, Exhibits, Orders, Judgments, Bail Documents, and Other Documents.

Supported files: PDF, DOC, DOCX, JPG, PNG, and scanned documents.

11. Exhibit Management

CASEORA maintains a record of exhibits produced or referred to in a case.

Information stored: exhibit number such as Exhibit P-1, document name, description, upload date, related hearing, whether the original is available, and notes.

12. Order Management

Advocates can save court orders and keep their own notes with them.

Information stored: order date, order type, original order PDF, advocate notes, and an AI-generated plain-language summary.

The original order remains available because the AI summary is only for easier understanding and verification.

13. AI Case Summary

AI creates a short overview of the case from available records.

The summary can show: parties and roles, main dispute, court information, important dates, important documents, sections/Acts, previous orders, current case stage, and pending tasks.

14. AI “What Happened?”

This feature answers: **What has happened in this case so far?**

AI converts the hearing history and case records into a simple chronological explanation.

Example: Case Filed → Notice → Appearance → Reply → Evidence → Exhibits → Arguments → Order.

15. AI “What Next?”

This feature answers: **What needs to happen next?**

It shows the apparent current stage, completed steps, pending steps, next recorded action, next hearing, and documents that may be needed based on available case records.

16. Case Timeline

The timeline gives a visual view of the complete case journey.

Typical stages: Case Filed → Notice → Appearance → Reply → Exemption → Evidence → Exhibits → Arguments → Order → Judgment → Disposed.

Each stage can open its related notes, hearing entries, and documents.

17. Case Disposal & Archive

When a case ends, CASEORA records the disposal date, final result, final judgment/order, reason, final documents, and advocate notes.

Disposed cases are not deleted. They remain in the archive and can be searched using case number, client name, year, court, case type, CNR number, or disposal date.

18. Search

Users can quickly search case records using case number, client name, opposite party, court, CNR number, document, order, or keyword.

Example: Searching a CNR number can locate the related case and its records.

19. Notifications

CASEORA reminds the advocate about important events and pending work.

Alerts include: today's hearing, tomorrow's hearing, upcoming hearing, pending task, reply deadline, exemption work, compliance date, and important orders.

20. Advocate Dashboard

The dashboard gives a quick overview of the advocate's workload.

It can show: total cases, active cases, pending cases, upcoming hearings, pending tasks, high-priority cases, disposed cases, and today's schedule.

21. Security Requirements

Because case records and legal documents can be sensitive, CASEORA needs strong security controls.

Security features: secure login, JWT authentication for API access, role-based permissions, protected/encrypted documents, secure database, automatic backups, session management, audit logs, and PIN/biometric lock where supported.

22. Team Management

CASEORA supports different team roles so access can be controlled.

Admin Advocate: broad access to cases, team, documents, hearings, tasks, and settings according to permissions.

Associate Advocate: works on assigned cases and updates relevant records according to permissions.

Clerk: can be given access to calendar, documents, hearing dates, and tasks.

23. Key Concepts — Easy Explanation

Case Registration: Creates the basic case record.

Previous Proceedings: Short summary of earlier hearings for context.

Case Diary: Detailed notes about a particular hearing.

Tasks: Work that the advocate/team needs to complete.

Timeline: Complete journey of the case from filing to disposal.

AI What Happened?: Explains the case history in simple chronological form.

AI What Next?: Highlights pending work and the next recorded actions.

24. Overall Working of CASEORA

1. Advocate creates a profile and logs in.
2. A new case is registered with court and party details.
3. Documents are uploaded into case-specific folders.
4. Hearings are added to the calendar and reminders are generated.
5. After each hearing, the advocate records the Case Diary.
6. Tasks are created and assigned to team members.
7. Orders and exhibits are stored with the case.
8. AI summarizes the case, explains what happened, and highlights what may come next.
9. The timeline keeps the entire case journey organized.
10. When the case ends, the final result is recorded and the case moves to the archive.

25. Final Requirement / Important Note

CASEORA is intended to help advocates organize cases, understand documents, track work, and manage deadlines. Its AI features should assist with organization and document understanding.

AI must not be treated as the final legal authority. Important factual or legal conclusions and decisions must be verified against the original court records and applicable law.
